

ABSTRACT

A mobile terminal (1) includes a call request unit (11), a memory unit (12), and a call request probability generation unit (13). A base station (2) includes a traffic measurement unit (21), and a call regulation transmission unit (22). The call request unit (11) acquires a transmission destination telephone number (111) which has been requested by a subscriber. Moreover, the call request unit (11) receives a call regulation signal from the base station (2) and acquires call regulation values M_{1112} , M_{2113} ($M_1 < M_2$). The call regulation values M_1 , M_2 ($M_1 < M_2$) are assumed to be a call regulation value M_{1112} for the transmission destination telephone number having priority and a call regulation value M_{2113} for other than the transmission destination telephone number having priority.
